

1) getpid() function in C

When any process is created, it has a unique id which is called its process id. The `getpid()` function returns the process id of the calling function, this function is defined in `unistd.h` header file.

Syntax:

```
pid_t getpid();
```

2) getppid() function in C

The `getppid()` function returns the process id of the parent function. It is also defined in `unistd.h` header file.

Syntax:

```
pid_t getppid();

// C program to demonstrate the example of
// getpid() and getppid() functions

#include <stdio.h>
#include <sys/types.h>
#include <unistd.h>

// Main function
int main(void)
{
    // Variable to store calling function's process id
    pid_t process_id;
    // Variable to store parent function's process id
    pid_t p_process_id;

    //getpid() - will return process id of calling function
    process_id = getpid();
    //getppid() - will return process id of parent function
    p_process_id = getppid();

    // Printing the process ids
    printf("The process id: %d\n", process_id);
```

```
printf("The process id of parent function: %d\n", p_process_id);
```

```
return 0;
```

```
}
```

RUN 1:

The process id: 31120

The process id of parent function: 31119

RUN 2:

The process id: 60

The process id of parent function: 59

RUN 3:

The process id: 972

The process id of parent function: 971
